

Timbuktu Pro

Control

- Take mouse and keyboard control of a remote computer while simultaneously viewing the remote desktop.
- Send and retrieve entire files and folders from desktop-to-desktop without tying up email.
- Share your screen to quickly resolve issues or guide other remote users through lessons, presentations, or training.
- View one or multiple desktops at the same time; perfect for individual or multiple user support.

Windows or Macintosh

- Timbuktu Pro is designed to communicate across different operating systems, whether Windows or Macintosh.

Secure

- SSH encryption, user authentication and a host of advanced security policies ensure that your connections and systems remain secure.

Timbuktu® Pro Remote Control Software

For Windows and Macintosh

For nearly twenty years, Timbuktu® Pro has been the standard for desktop-to-desktop remote control software for the Windows and Macintosh operating systems. With a host of new features including integration with Skype™ and support of Intel-based and PowerPC Macintoshes, Timbuktu Pro lives up to its reputation as the solution for those who want to stay in control wherever they go.

Being There

When remote users need your assistance, they need it now—not after you’ve run down the hall, driven across town, or talked them through a series of unfamiliar mouse-clicks by phone. With Timbuktu Pro, you’re always there—virtually. Whether providing technical support, collaborating on projects, or accessing your own files from a remote location, Timbuktu Pro lets you find and operate distant computers as if you were sitting right in front of them.

Finding Other Users

Timbuktu Pro helps you find remote computers easily and quickly, anywhere on the Internet—whether they’re on your local network, in a remote office, or anywhere else on the planet.

- Search for and connect to other Timbuktu Pro and Skype users through your Skype contacts list.*
- Within your network, find computers by their IP address or computer name. Or initiate Timbuktu Pro connections by right-clicking a computer in the Network Places** browser.
- Save frequently used addresses in Address Books or as desktop shortcuts.
- Use the Internet Locator Service to find and connect to other Timbuktu Pro computers, anywhere on the Internet, using only the user’s email address.
- Browse your local network with Bonjour*** to find and connect to other Timbuktu Pro computers.
- Use the list of recent connections to easily reestablish a connection.

Collaboration

With Timbuktu Pro, you can view other computer screens, or invite remote users to view yours.

In addition to sharing your screen with multiple users, you can view multiple remote screens simultaneously. Using the shrink-to-fit display option, you can view those remote screens side by side. It’s ideal for monitoring students in the classroom or administering multiple remote servers.

Of course, sometimes you don’t need total control or don’t wish to allow others to control your computer. Timbuktu Pro allows you to decide whether to use the Control service, which permits full remote control, or the Observe service, which allows full screen-sharing access without mouse or keyboard control.

To adapt to slower connections or large numbers of simultaneous users, you can dynamically reduce the number of colors sent during screen-sharing, saving bandwidth and preserving your connection speed.

Communication

Timbuktu Pro makes collaboration easy by incorporating all types of communications. Send instant text messages, text chat, and even use your microphone and speakers to talk to other users while simultaneously running Timbuktu Pro’s remote control and screen-sharing services.

* This feature available on PCs and Macs running Timbuktu Pro and Skype.
 ** This feature available only on Timbuktu Pro for Windows.
 *** This feature available only on Timbuktu Pro for Mac OS X.

Exchange files and folders as attachments to instant messages or drag and drop files directly from the screen-sharing window** to your own desktop.

What Timbuktu Pro Can Do For You

MAC	WINDOWS
Control the remote computer mouse and keyboard	Control the remote computer mouse and keyboard
View the remote computer's screen	View the remote computer's screen

Push install Timbuktu Pro onto remote computers	Choose to share only part of your screen
View system profile of remote computer	Store Timbuktu Pro logs on central server
Universal application for Intel and PowerPC	Microsoft Windows 2000, Windows XP or Windows 2003

Security

These days, you're probably more concerned with keeping people out of your computer than with letting them in. Timbuktu Pro's multiple layers of security and encryption are designed to keep your computer and its data secure.

- **Access security:** You can assign separate access privileges to each Registered User you define in the Security dialog box. You can even leverage the operating system's own security by creating System Authenticated Users, who will log in with their Mac OS X or Windows user name and password. Plus, all remote users can be required to Ask for Permission before accessing your computer.
- **Data security:** Timbuktu Pro connections can use your VPN, taking advantage of its encryption. Or choose Timbuktu Pro's SSH-encrypted connection option. Either way, the remote control data stream is scrambled using Netopia's proprietary protocol.

- **Application security:** With Timbuktu Pro's Master Password, you can protect all of your preferences, security options, and user-access permissions from unauthorized changes.

Skype Integration

From the familiar Timbuktu Pro interface, users can now search for, connect to, and collaborate with other Timbuktu Pro and Skype users through their Skype contacts list. Timbuktu Pro leverages Skype's API to automatically navigate through routers, firewalls and NAT devices. Users can even launch a Skype call from within Timbuktu Pro. The integration of Timbuktu Pro and Skype combines the best desktop remote control software with the premiere Internet telephony application which provides users with a robust and versatile collaboration experience.

Availability

Whether your computers are all Macintosh, all Windows, or some of each, Timbuktu Pro is sold in packages convenient for you. And if you add computers later, don't worry— there's no special version needed to connect between Windows and Macintosh. All you need is Timbuktu Pro on both computers!

System Requirements

- Mac OS X 10.3.9 or higher
- Microsoft Windows 2000, Windows XP, or Windows 2003 Server
- 20 MB of available disk space (15 MB on Macintosh)
- A working Internet or network connection (TCP/IP)
- A working microphone and speakers are required for the Intercom service
- One copy of Timbuktu Pro software on each computer that is to make or receive Timbuktu Pro connections
- Other versions of Timbuktu Pro are compatible with Macintosh Classic

* This feature available on PCs and Macs running Timbuktu Pro and Skype.

** This feature available only on Timbuktu Pro for Windows.

*** This feature available only on Timbuktu Pro for Mac OS X.
